

Risk Management and Mitigation Plan

Risks	Category	Probability	Impact	RMMM (Risk Monitoring & Mitigation Plan)
Security Breaches (Improper encryption of user data may cause data leaks, unauthorized access, and regulatory violations)	TE	50%	1	Implement end-to-end encryption along with multi-factor authentication and regular security audits to detect vulnerabilities before exploitation.
Performance-Bottleneck (High concurrent user loads may cause slow response times or system timeouts)	TE	60%	2	Use load balancing and horizontal scaling to efficiently manage traffic and maintain performance under high user load.
Lack of proper backups can lead to loss or corruption of critical health records.	TE	40%	2	Use automatic versioned backups and redundant cloud storage with regular disaster recovery tests to prevent data loss or corruption.
Emergency Handling Delays	CU	40%	2	Use event-driven architecture with redundant alert channels to ensure instant and reliable emergency alert delivery.
Communication Failures	ST	40%	2	Use a real-time communication platform with fallback protocols and auto-reconnect to ensure stable, low-latency communication.
Delay in third-party API integration	TE	30%	3	Use mocks/stubs for early development; stay in touch with API provider.
